

Innovations:

Added Functionality

Using Mysql I created a product recall notice that sits on the front page of the webpage

this product recall functionality lists the product and has a mysql entry for the product id too (although I didn't enter product id in my test data)

Add Manager

- 1. Manager ID must be 4 characters**
- 2. Name must be > 5 characters**
- 3. Salary must be between 30,000 and 70,000**

Manager ID

Name

I also added various style innovations throughout the application to spruce it up and make it

more user friendly

I also added a few checks on the 'add store' page - that was not required on the project sheet - however I suspect this was a mistake and this functionality was necessary anyway

Thank you for grading my project - any feedback would be much appreciated
